

# where's my DIPSTICK

...a new car maintenance service that enhances your buying experience with a learning one.

## air filters

### What is an air filter?

We stop airborne impurities from getting sucked into your car's engine!  
Typically I'm a paper filter that stops debris such as dust, leaves, grit etc, before they get inside the engine and do damage.

### Why do I have to do this?

Eventually, I will become clogged 😞

### What happens if you don't change me?

If I get clogged up or too dirty, your engine won't be able to suck enough air into the combustion chambers. The engine will then run rich (i.e. too much gas and not enough air). When this happens, your car will lose power and run roughly. Your Check Engine light also may come on.

If you really neglect me, your car may stop running altogether! While permanent damage is unlikely, it is possible. If I am sufficiently dirty and damaged, harmful and abrasive contaminants would leak into combustion chamber. ■
